CKB WorkFlow Action Template

Introduction:

This is the template for setting up a proper Workflow Action in the forked repository to interact with the CKB platform. If you do not set it up, every push you make will not be evaluated and therefore your score will be 0.

WorkFlow Action Template:

```
name: Pull Request Notification

on:

  push:

    branches:

      - main

jobs:

  notify:

    runs-on: ubuntu-latest

    steps:

      - name: Checkout repository

        uses: actions/checkout@v2

      - name: Notify Endpoint

        run: |

          curl -X POST -H "Content-Type: application/json" -d '{"pusher": "${{ github.actor }}", "repository": "${{ github.repository }}" }' YOUR_ENDPOINT_URL
```

Problem:

As the web app works on localhost we use "ngrok" to create a tunnel to our application. By appending /ckbplatform/pulls it will call the right endpoint on the local host.
